Web Vocabulary

WEB Applications

- A **web application** refers to a software application hosted on a server and accessible via a web browser.

- Unlike traditional software, the user of a web application does not need to install a program on their computer. Instead, they connect to the application using their preferred browser, and the server processed their request, runs the appropriate code, and returns a response.

API -Application Programming Interface

- An API is a programming interface that allows you to "plug" into an application to exchange data.

- An API makes it possible to provide a certain level of abstraction to the developer. It masks the complexity of access to a system or an application by proposing a set of standard functions whose only parameters and the returned values are known.

Ex: api google map
Api weather
Api to know the currencies
